Abstract (Basic): JP 2000041144 A

NOVELTY - The image parameter processor (106) of a central processing unit (102) combines and forms the received parameters into a watermark in a generated digital image. The parameters are the image data, object data, time data, date data, position data, and the user data. The central processing unit controls and function and the operation of the whole system.

DETAILED DESCRIPTION - An image capture unit generates the digital image of the observed image frame, and generates image data relevant to the generation of the digital image. A wireless communication unit receives the object data. A geographical position determination unit is used to determine the geographical coordinate of the system when the digital image is generated.

An INDEPENDENT CLAIM is also included for an image capture procedure.

USE - For verifying the authenticity of a digital image. Used for a digital camera.

ADVANTAGE - Enables automatic formation of a watermark in the image obtained by the digital camera.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the image capture system.

Central processing unit (102)

Image parameter processor (106)
